1 Why reliable trimodal decisions matter

2 Capability vs. calibration in decision models

Capability: choose the right answer

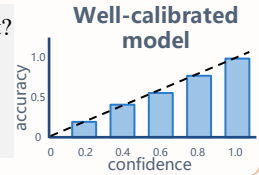

Q: What animal is shown?

A. cat
B. dog ✓
C. bird

Calibration: confidence matches correctness

Example	Answer	Confidence	Correct?
	Bird	0.90	×
	Dog	0.60	√

3 Key pain points in trimodal decisions

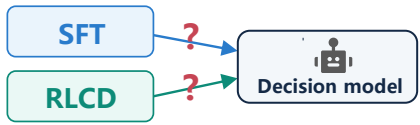

3.1 Trimodal training is underexplored

Most existing work trains **text** *decision models*

3.2 Roles of SFT and RLCD are unclear

SFT and RLCD's contributions to **capability** *and* **calibration** *are hard to attribute.*

3.3 RL calibration gains are inconsistent

Reward-driven training often does not make confidence more reliable, even **hurt calibration**.

4 Takeaway: separating capability from calibration

Need a training recipe that separates capability building from confidence calibration.
